

Automation & Workflow Optimization

Overview

The **Automation & Workflow Optimization** phase focuses on automating task processing using **Flow Designer** in ServiceNow. Instead of relying on manual updates, workflows automatically execute predefined actions whenever specified conditions are met. This improves efficiency, ensures consistent task handling, reduces human error, and provides managerial oversight through automated approval processes.

In this activity, a new flow named **Task Table** is created within the **Global** application. The flow serves as the foundation for automating task lifecycle management, including status updates, assignment validation, and approval routing to the Project Manager.

Create Flow for Task Table

Objective

The objective of this activity is to create a Flow in **Flow Designer** that automates the processing of records in **Task Table 2**.

The flow will:

- Monitor Task Table records
 - Trigger automatically when predefined conditions are met
 - Support automated task processing
 - Reduce manual intervention
 - Prepare tasks for approval workflows
-

Procedure

Step 1: Open Flow Designer

1. Open **ServiceNow**.
2. Navigate to:

All → Search "Flow Designer"

3. Select **Flow Designer** under **Process Automation**.

The Flow Designer workspace opens.

Step 2: Create a New Flow

1. Click **New**.
2. Select **Flow**.

The **Flow Properties** window appears.

Step 3: Configure Flow Properties

Enter the following information:

Property	Value
----------	-------

Flow Name	Task Table
-----------	------------

Application	Global
-------------	--------

Verify that all details are correct.

Step 4: Build the Flow

Click **Build Flow**.

The Flow Designer canvas opens, allowing triggers, conditions, and actions to be added.

Flow Configuration

After creation, the flow contains the following basic configuration:

Configuration	Value
---------------	-------

Flow Name	Task Table
-----------	------------

Configuration Value

Application	Global
Platform	Flow Designer
Status	Draft
Purpose	Automate Task Table processing

Validation

To verify successful flow creation:

1. Open **Flow Designer**.
 2. Confirm that the **Task Table** flow appears in the flow list.
 3. Open the flow.
 4. Verify:
 - Flow Name is correct.
 - Application is **Global**.
 - Flow Builder canvas opens successfully.
-

Expected Outcome

After completing this activity:

-  Flow Designer is successfully accessed.
 -  A new flow named **Task Table** is created.
 -  The flow belongs to the **Global** application.
 -  The flow is ready for adding triggers, conditions, and actions.
 -  The automation framework is established.
-

Benefits

Creating the Task Table flow provides:

- Automated task processing

- Standardized workflow execution
- Reduced manual effort
- Improved process consistency
- Better project tracking
- Faster approval routing
- Increased operational efficiency

Conclusion

The successful creation of the **Task Table** flow establishes the automation framework required for task management within the ServiceNow platform. By creating the flow in the **Global** application, the system is prepared for implementing automated triggers, conditions, task updates, and approval workflows. This foundation supports efficient task processing, minimizes manual intervention, and ensures consistent execution of business processes across the application.
