

Role Management – Creation of Roles

Objective

The objective of this activity is to create custom roles in ServiceNow to implement **Role-Based Access Control (RBAC)**. Roles determine the permissions granted to users and ensure that only authorized users can access or modify project information.

Two custom roles are created:

- **Project Manager Role** – Provides full access to project and task records.
- **Team Member Role** – Provides restricted access, allowing users to view and update only their assigned tasks.

This role-based approach enhances security, accountability, and efficient project management.

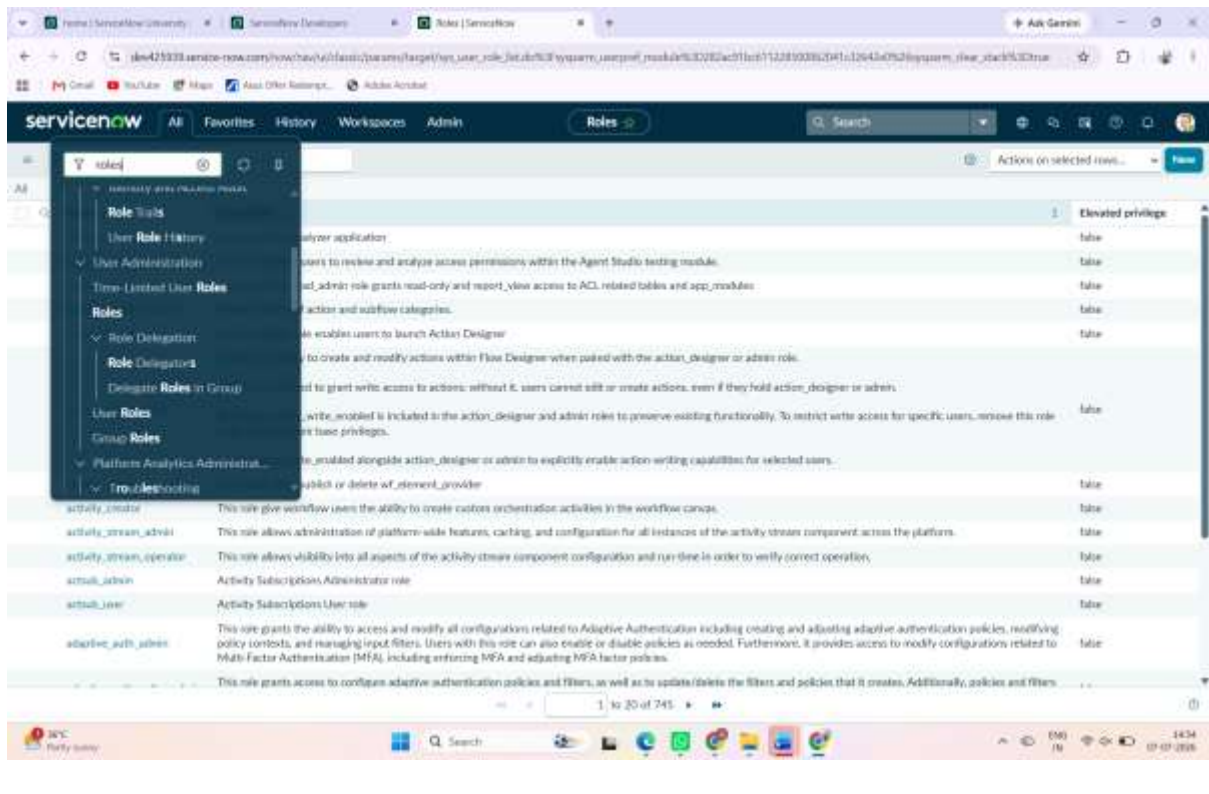

Procedure

Step 1: Navigate to Roles

Open the **Application Navigator** and navigate to:

System Security → Roles

The Roles list displays all existing roles available in the ServiceNow instance.

Step 2: Create the Project Manager Role

Click the **New** button to open the Role creation form.

Enter the following information:

Field Value

Name Project Manager Role

Description Full access to project and task tables

Click **Submit** to save the role.

Permissions

The **Project Manager Role** provides permission to:

- Create project records
- Read all project and task records
- Update project and task information
- Delete records when required
- Assign tasks to team members
- Approve completed tasks

- Monitor overall project progress

Step 3: Create the Team Member Role

Click **New** again to create another role.

Enter the following information:

Field	Value
-------	-------

Name	Team Member Role
------	------------------

Description	Restricted access to assigned project tasks
-------------	---

Click **Submit**.

Permissions

The **Team Member Role** allows users to:

- View assigned tasks
- Update task status
- Add comments and work notes
- Mark assigned tasks as completed

Restrictions

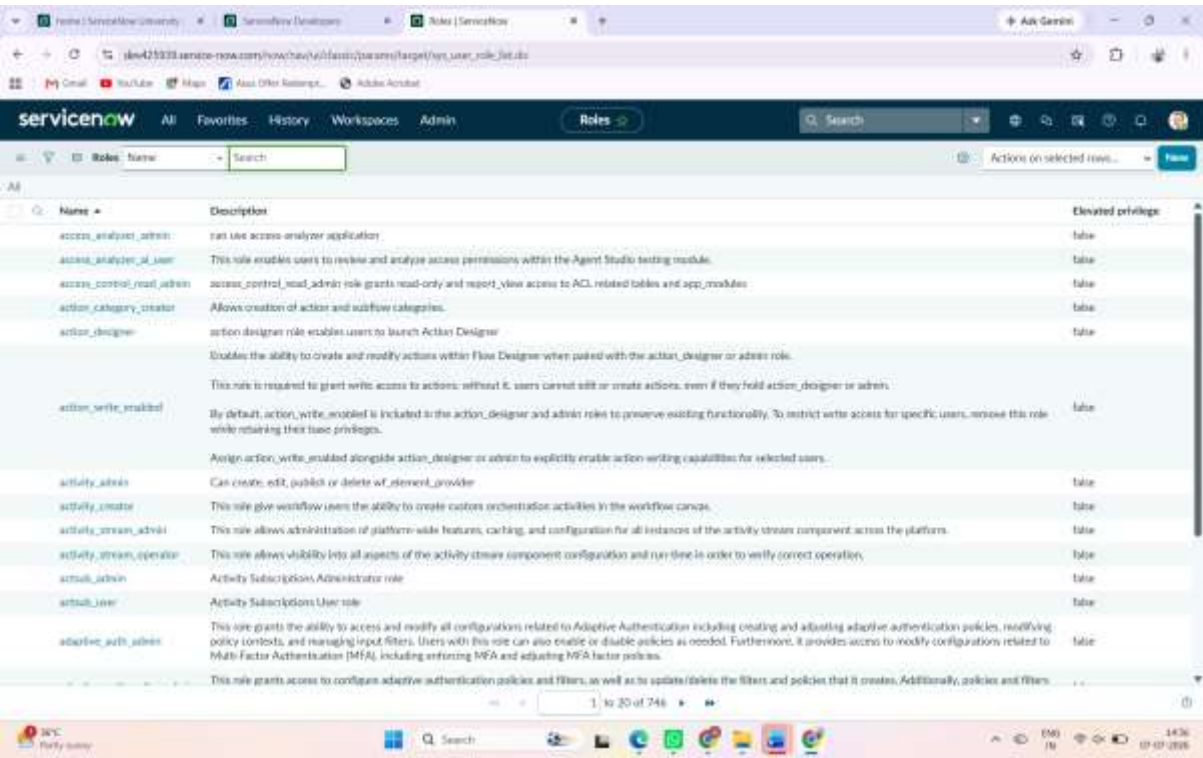

Users with this role cannot:

- Create projects
- Modify project details
- Delete records
- Access unassigned tasks
- Approve project activities

Step 4: Verify Created Roles

After saving both roles, verify that they appear in the Roles list.

Role	Description
Project Manager Role	Full access to project and task tables
Team Member Role	Restricted access to assigned tasks

Expected Outcome

After completing this activity:

- The **Project Manager Role** is successfully created with full project management permissions.
 - The **Team Member Role** is successfully created with limited task management permissions.
 - Both roles are available for assignment to users.
 - The foundation for secure Role-Based Access Control (RBAC) is established.
-

Benefits of Role Management

Implementing custom roles provides several advantages:

- Enforces Role-Based Access Control (RBAC).
 - Protects project data from unauthorized access.
 - Clearly separates responsibilities between users.
 - Improves accountability and governance.
 - Supports secure and scalable application management.
-

Conclusion

The successful creation of the **Project Manager Role** and **Team Member Role** establishes the security framework for the application. By assigning permissions according to user responsibilities, the system ensures that Project Managers have complete control over project activities while Team Members are limited to managing their assigned tasks. This role-based approach enhances security, maintains data integrity, and supports efficient project execution within the ServiceNow platform.
