

Data & Structural Configuration

Overview

The **Data & Structural Configuration** phase focuses on establishing the core data architecture required for project and task management within ServiceNow. This phase involves creating custom tables that store and organize project-related information and task details.

A custom **Project Table** is created to maintain project information such as project name, owner, and deadline. The table is configured with application modules and mobile modules to provide easy access through the ServiceNow platform.

A separate **Task Table 2** is configured to manage individual tasks, including task name, description, status, comments, and assigned users. These tables provide a structured foundation for implementing workflows, access controls, task assignments, and project tracking.

Creation of Project Table

Objective

Create a custom table named **Project Table** in ServiceNow to store project-related information.

Procedure

Step 1: Navigate to Tables

1. Open **ServiceNow**.
2. Navigate to:

All → Search "Tables"

3. Select:

System Definition → Tables

The Tables list displays all existing tables in the ServiceNow instance.

Step 2: Create a New Table

Click the **New** button to create a custom table.

Enter the following information:

Field	Value
Label	Project Table
Name	u_project_table
Create Module	Checked
Create Mobile Module	Checked
New Menu Name	Project Table

ServiceNow recommends creating custom tables in scoped applications. To learn more about creating scoped applications, click [here](#).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More info](#)

Label: Project Table
 Name: s_project_table
 Extends table: [Search]

Application: Global
 Create module: ☒
 Create module module: ☒
 Add module to menu: -- Create new --
 New menu name: Project Table
 Reuse Table: ☐

Step 3: Define Table Columns

Create the required fields for storing project information.

Field Name	Type	Description
Project Name	String	Stores the project title
Owner	Reference/User	Stores the project manager information
Deadline	Date	Stores project completion deadline
Description	String	Provides project details
Status	Choice	Tracks project progress
Priority	Choice	Defines project importance

These fields allow effective project tracking and reporting.

Step 4: Submit and Create Table

After entering all required information:

- Verify the table configuration.
- Click **Submit**.

ServiceNow creates the custom **Project Table** with the configured modules.

Task Table 2 Configuration

Objective

Create a task management table to store and track individual project activities.

Task Table Fields

The Task Table 2 contains the following fields:

Field Name	Type	Description
Task Name	String	Name of the task
Description	String	Task details
Assigned User	Reference/User	User responsible for task
Status	Choice	Task progress status
Comments	String	Additional information
Work Notes	Journal	Task updates
Due Date	Date	Task completion date

Field Name	Type	Description
Project Reference	Reference	Related project

Application Modules Configuration

The created tables are configured with modules for easy navigation.

Project Module

Allows users to:

- View projects
- Create projects
- Manage project information

Task Module

Allows users to:

- View assigned tasks
 - Update task progress
 - Manage task activities
-

Expected Outcome

After completing this phase:

- Project Table is successfully created.
 - Task Table 2 is configured for task management.
 - Required fields are added.
 - Application modules are generated.
 - Mobile modules are enabled.
 - Data structure is ready for workflows and access controls.
-

Benefits of Data Configuration

The custom table configuration provides:

- Organized project and task data storage.

- Improved reporting and tracking.
- Easy integration with workflows.
- Support for role-based access control.
- Better project visibility and accountability.
- A scalable foundation for future enhancements.

Conclusion

The Data & Structural Configuration phase successfully establishes the database structure required for project management in ServiceNow. The creation of the **Project Table** and **Task Table 2** provides a structured environment for storing project details, managing tasks, and supporting workflow automation. These tables serve as the foundation for implementing access controls, task assignments, approvals, and project lifecycle management.
